1 Some implications of shared variables   77%
   Adin D. Falkoff
   Proceedings of the eighth international conference on APL September 1976
      Recognition of shared variables as the fundamental means of
      communication between concurrently operating processes has important
      implications for the design of systems and programming languages. As a
      consequence, current APL systems, such as APLSV, embody two shared
      variable facilities: one for establishing temporary interfaces between
      system components, and the other one for defining parts of the permanent
      interface between an APL program and the underlying processor. These are
      treated in ...

Proceedings of the 1990 conference on Supercomputing October 1990

> This paper describes and analyzes two algorithms for maintaining cache coherence in multiprocessor systems with parallel communication channels and many processors. A distributed link-list relates all cache frames representing the same main memory block. Messages traverse the list to maintain list integrity, exclusive ownership, and consistent values. Memory access semantics are equivalent to a shared memory system without caches. Reference latency, efficiency of memory use, and hardware co ...

Previous systems, such as Rooms, limit users by constraining the interaction to the desktop monitor. In Kimura, we leverage interactive projected peripheral displays to support the perusal, manipulation and awareness of background activities. Furthermore, each activity is represented by a montage comprised of images from current and past interaction on the desktop. These montages help rem ...

> For the maintenance of a switching system, many levels of expert's decisions may be required to find a correct cause and its appropriate repair procedure. Output messages generated by our switching system, called TDX-1A, for the maintenances have, in general, the following characteristics: A bunch of maintenance messages generated only by even not many trouble/faults make it hard for an operator to maintain. Approximately 10 messages are generated by a fault. ...
